Introduction

Over the years, health care delivery model has been transformed several times. For instance, 200 years ago, health care was provided to patients through a family physician in their homes. Since the 20th century, health care services have been centralized in hospitals, and it gradually shifts towards near-the-patients location in the advent of emerging technologies, including wireless communication and mobile devices [1, 2]. In fact, information and communication technology (ICT) are transforming the face of health care delivery from organization-based to personalized one [3] facilitating patients’ status monitoring ubiquitously in a non-invasive way [4].

In parallel with these trends, medical records have been subject to great changes according to its 4000-year history, ranging from papyrus text (in 1600 B.C.) physicians narrative records of hospital structured
forms (at the end of the 19th century), afterwards, to different forms of electronic health records (at the end of 21st century) [5].

Nowadays, an increasing prevalence of many chronic health conditions is the prime cause of death all over the world [6]. Furthermore, according to studies, the burden of chronic health conditions has risen among all individuals in many countries, especially developing nations [7]. Moreover, health care costs are escalating as growing elder population [8] as the elderly are more vulnerable to diseases particularly chronic conditions [9, 10]. In addition, healthcare is changing because of the shifting of telemedicine from desktop platforms to wireless and mobile configuration as society has become mobile [11]. Therefore, pervasive health care (e.g. smart home, mobile and ubiquitous telemedicine, pervasive patient monitoring, intelligent emergency monitoring and pervasive life style management) is widespread across the world, aiming at economizing health care resources, providing health care efficiently as well as managing chronic conditions [12, 13].

On the whole, technology advancement intensified individual and organizational privacy concerns for common characteristics, including ubiquity, invisibility, sensing and memory augmentation [14]. Obviously, studies have shown the risks as data modification, impersonation, eavesdropping, and replaying may endanger health information security and privacy [15]. According to National Committee for Vital and Health Statistics, health information privacy is defined as “the right to control the acquisition, uses or disclosures of individually identifiable health information” [16]. In recent years, researchers examined important issues, especially privacy issues in pervasive healthcare despite the fact that it is an evolving concept [17]. Literature revealed that several frameworks in this regard developed over the years. This paper was aimed at providing a snapshot of such a framework protecting health information privacy in pervasive healthcare settings to obtain an outlook for developing a customized overarching framework in terms of common concepts as well as exclusive ones.

This review study was conducted searching following terms such as “pervasive health care”, “mobile health”, “ubiquitous health”, “health information”, “framework” and “privacy” in PubMed-Medline, Springer, Magiran, Scientific Information Databases and on the Internet search engines using the free text both in English and Persian in February 2015. Relevant frameworks were retrieved and compared.

Here, some major frameworks are outlined comprising actionable principles protecting health information privacy (Table 1).

These frameworks look alike in the light of major themes, displayed as the core of our proposed framework in Figure 1. It does not make any difference which health information has been exchanged in conventional or modern health care settings, considering these common issues is imperative. Depending on the context of the subjected framework being used some technical items, for instance, particular items both in m-Health and Implantable Medical Devices (e.g. adaptability, availability, manageability and privacy and security issues related to IMDs) would be added.

Reviewing aforesaid frameworks indicated that privacy protection frameworks developed based on previous ones, over the years and developed gradually. In parallel with the emergence of new technologies, new issues and challenges are detected, and researchers seek appropriate solutions meeting the requirements of privacy improvement and its reinforcement.

**Discussion**

The potential risks to individuals’ information privacy are associated with the disclosure of personal health information either deliberately or unintentionally both in conventional and pervasive health care settings. However,
information privacy and pervasive health

<table>
<thead>
<tr>
<th>Framework</th>
<th>Objective</th>
<th>Components</th>
</tr>
</thead>
<tbody>
<tr>
<td>Markle Common Framework for Networked Personal Health Information [18, 19]</td>
<td>To indicate the way of health information exchange and protection</td>
<td>Fair Information Practice Principles were the core of this framework. It contains 16 policies and technical documents; model contract language.</td>
</tr>
<tr>
<td>National Framework for Electronic Exchange of individually identifiable health information [20]</td>
<td>To guide public and private entities in order to hold and exchange health information properly.</td>
<td>The international, national, and public and private sector privacy and security principles, concentrating on individual information in an electronic environment, particularly individually identifiable health information such as popular privacy frameworks (e.g. Asia-Pacific Economic Cooperation privacy framework), related guidelines (e.g. Organization for Economic Cooperation and Development (OECD) Guidelines on the protection of privacy and personal data exchange across the countries) relevant Acts (e.g. Personal Information Protection and Electronic Documents Act and Health Insurance Portability and Accountability Act)</td>
</tr>
<tr>
<td>Framework for health information on wearable devices [21]</td>
<td>To address major security requirements in wireless body area network</td>
<td>A comprehensive privacy protection package based on existing frameworks categorized in three groups, including data storage (e.g. confidentiality, ongoing control over and dependability); data access (e.g. access control/privacy, accountability, abrogation the violator's accessibility to data, and strictly tracking user activities) and also encompassing authentication and availability</td>
</tr>
<tr>
<td>Conceptual privacy framework for health information on wearable device [22]</td>
<td>To provide complete privacy protection package to wearable device owners.</td>
<td>Markle Common Framework for Networked Personal Health Information and The Certification Commission for Health IT Framework has formed this framework. It contains 10 principles and 9 checklists.</td>
</tr>
<tr>
<td>Framework Model and Principles for Trusted Information Sharing in Pervasive Health [23]</td>
<td>To analyze pervasive health care in terms of trustworthiness and privacy challenges.</td>
<td>This includes following concepts: Information space, pervasive health, trust, systems, stakeholders' interest/concerns, environment, and privacy.</td>
</tr>
<tr>
<td>A general framework for evaluating the security and privacy of next-generation wireless implantable medical devices [24]</td>
<td>To recognize the design goal of security and privacy for implantable medical devices.</td>
<td>It consists of some criteria for implantable medical devices including, safety and utility as well as security and privacy.</td>
</tr>
<tr>
<td>A Privacy framework for mobile health and home-care systems [16]</td>
<td>To restate common framework principles and describe privacy properties being used in health systems.</td>
<td>Common framework, health privacy best practices; The Certification Commission for Health IT Framework and ONC principles have built it. Moreover, many special items unique to m-Health (e.g. adaptability, the possibility to growing use, efficiency, usability, manageability, and availability.</td>
</tr>

</table>

In comparison with conventional health care delivery, pervasive health care, a dynamic and open culture of information sharing among all health care stakeholders entails more concentration on privacy issues. The more readability and quickly health information exchange among different entities (e.g. health care organizations, health care providers, and payers as well as patients), the more the risk of privacy breach.
Given the above discussion, information privacy is a critical part of the right to privacy. Therefore, considering the incontrovertible effect of ICT in processing medical information, protecting information privacy is the prime challenge faced by health information custodians especially in modern personalized health care systems. Taking a look at popular frameworks, it seems that most of them have common characteristics in the protection of personal health information. These are embedded at the center of this proposed framework (Figure 1), articulating five main areas, including health information collection, the obtainment of individual consent prior to authorized users access, disclosure and use of health information in a pervasive healthcare setting (e.g. m-Health, Implantable Medical Devices, monitoring individual health status from distance).

As a whole, the principles of privacy protection of health information are considered in a continuum ranging from health data generation, transmission to storage and access.

The right understanding of common Information and Communication Technologies (ICTs) and monitoring the emerging technologies seems imperative in the development of privacy protection of health information. However, this framework is based on information collection, use, disclosure and the right of individuals to access to personal health information (both manual and electronic), consideration of modern and different platforms leading to recognizing the potential drawbacks.

Entirely, “privacy” concept evolves over the years. The advent of new technologies is influential in this regard. Normally, it appears that this new concept requires more attention.

Figure 1: Proposed Framework on Protection of Health Information Privacy in Pervasive healthcare.
to get mature. Therefore, making more efforts for others to learn from their best practices, applied guidelines, existing frameworks in view of the national high rate of penetration of modern technologies (e.g. telemedicine, teleconsultation and telecare) and public adoption of ICTs (e.g. personal computers, tablets, mobile phones, smart phones and social networking sites) deems necessary.

Conclusion
In summary, some relevant conceptual and practical frameworks are described in brief. These frameworks were similar in basic principles governing data access, collection, use, and disclosure. In conclusion, it is wise to consider the common concepts as building blocks of forthcoming frameworks on the protection of privacy in the emerging health environment.
